<<中国植物志第20-21卷>>

章节摘录

截叶蓝刺头 Herbs to 45 cm tall , perennial. Stem solitary , branched below middle , sparsely cobwebby. Leaves leathery , abaxially gray to grayish green and thinly cobwebby , adaxially green , glabrous , and shiny. Lower caudate leaves sessile , lanceolate , ca. 10.5 X 5.5 cm , base truncate , margin with spine-tipped teeth. Middle caudate leaves similar but gradually smaller upward , Uppermost caudate leaves lanceolate to elliptic. Pseudocephalica. 4 cm in diam. Capitula ca. 1.3 cm. Phyllaries 20 or 21 , abaxially glabrous ; outermost phyllaries oblanceolate , ca. 5mm , unequal in length , 1/3-1/2 as long as involucle , clawmargin sparsely long ciliate , distal portion broadly elliptic , cartilaginous , margin ciliate , and apex acuminate ; middle and inner phyllaries oblanceolate to narrowly elliptic , 0.8-1.3 cm , distal half of margin sparsely shortly appressed ciliate. Florets ca. 1.3 cm. Corolla blue , glabrous , tube ca. 5mm. Achene ca. 6mm , hairs yellowish. Pappus scales linear , to 2mm , unequal in length , connate for up to proximal half. Fl. and fr. Jul. 火焰草

Herbs 15-40 cm tall , perennial. Stems solitary or tufted , unbranched or 1-3-branched , cobwebby to lanate. Leaves leathery , abaxially whitish to grayish white and densely cobwebby to thickly lanate , adaxially green to yellowish green and sparsely cobwebby , margin and apex spiny. Basal and lower caudate leaves shortly petiolate ; leaf blade elliptic , elliptic-lanceolate , obovate-lanceolate , 10-20 x 2-8 cm , bipinnatifid or subpinnatifid , with 5-8 pairs of segments and a triangular ultimate lobe. Middle and upper caudate leaves sessile , gradually smaller upward , pinnatifid , semiamplexicaul. Pseudocephalia 1 to few , corymbose , 5-5 , 5 cm in diam. Capitula ca. 1 , 8 cm. Phyllaries 16-20 , abaxially glabrous ; outermost phyllaries oblanceolate , to 8mm , unequal in length , at least 1/2 as long as involucle , clawmargin sparsely long ciliate , distal portion broadly elliptic , cartilaginous , margin sparsely shortly ciliate , and apex acuminate ; middle phyllaries oblanceolate , ca. 1.5 cm , margin longappressed ciliate , apex narrowed into an awn ; inner phyllaries similar but longer. Corolla white or bluish , outside gland-dotted , tube ca. 5mm. Achene ca. 6mm , hairs yellowish. Pappus scales linear , mostly ca. 1mm , connate almost entirely. Fl. and fr. Jun-Aug. Sandy mountainous regions , desert steppes ; 500-2200 m. C Gansu , Nei Mongol , Ningxia , SE Shandong , Shanxi , N Xinjiang.

Although C. Shih and Y. Ling (FRPS 78 (1) : 6. 1987) indicated that Echinops przewalskyi occurs in Mongolia , the species was not included among the Echmops in Mongolia by V I. Grubov (Key Vascular PJ. Mongolia 2 : 665-666. 2001)
