

<<纳米科学与技术大全1>>

图书基本信息

书名：<<纳米科学与技术大全1>>

13位ISBN编号：9787030346568

10位ISBN编号：7030346564

出版时间：2012-7

出版时间：科学出版社

作者：戴维 L.安德鲁斯

页数：635

字数：1050500

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

<<纳米科学与技术大全1>>

内容概要

近年，纳米技术及其基础科学以前所未有的速度增长与发展。

基于此，纳米科学与技术大全1：纳米材料（导读版）旨在为读者们呈现一本动态的、权威的和真正能获得有效信息的参考著作，力求反映此学科领域全面而广阔的发展状况。

此书共有5卷，由国际专家组写作而成，内容涉及材料科学、物理学，生命科学、化学等领域；每篇文章的写作都兼具学术性、批判性与可读性，内容深入浅出，前后呼应，是一本跨学科领域研究者们不可或缺的有价值的参考资料。

纳米科学与技术大全1：纳米材料（导读版）适合化学、物理学、材料科学、生物学、工程学等领域的研究生及科研人员参考，对于纳米研究实验室、学术机构，涉及纳米和生物材料、材料科学等方面的专业组织、公司、企业等也是不可多得的参考资料。

<<纳米科学与技术大全1>>

作者简介

David L.Andrews、 Zeev Valentine Vardeny、 Duncan H.Gregory、 Thomas Nann

书籍目录

1.01 有机材料电子结构的量子化学计算1.01.1 Introduction1.01.2 Ground-State Properties of PBI Aggregates1.01.3 Excited-State Properties1.01.4 Summary and ConclusionReferences1.02 碳纳米管:电子结构和光谱1.02.1 Introduction1.02.2 Geometry of the CNT Lattice1.02.3 Electronic and Optical Properties1.02.4 Characterization of the Exciton State1.02.5 Photoexcitation Dynamics:The Critical Role of Defects1.02.6 Vibrational Modes in CNTs1.02.7 Coherent Phonons in CNTs1.02.8 ConclusionsReferences1.03 有机半导体中的激光作用1.03.1 Introduction1.03.1.1 Amplified Spontaneous Emission1.03.1.2 Superradiance and SF1.03.1.3 Cavity-Based Lasers1.03.1.4 Random Lasers1.03.1.5 Experimental Setup for Studying Laser Action1.03.2 Laser Action in PCPs1.03.2.1 ASE in Solutions and Thin Films of DOO-PPV Polymer1.03.2.1.1 SN in dilute DOO-PPV solutions1.03.2.1.2 ASE in DOO-PPV films with superior optical confinement1.03.2.1.3 Transient ASE dynamics in DOO-PPV films1.03.2.2 Cylindrical Microlasers of DOO-PPV1.03.2.2.1 Microring lasers1.03.2.2.2 Microdisk lasers1.03.2.3 Random Lasers in Films and Photonic Crystals1.03.2.4 RL and Cancerous Tissues1.03.2.5 SF in Organic Gain Media1.03.2.5.1 SN in DOO-PPV films with poor optical confinement1.03.2.5.2 SF in DSB single crystals1.03.3 SummaryReferences1.04 有机发光二极管及其应用综述1.04.1 Introduction and Historical Milestones1.04.2 Electronic Structure of and Processes in Luminescent π -Conjugated Materials1.04.2.1 Electronic Structure1.04.2.2 Monomolecular Processes1.04.2.3 Bimolecular Processes1.04.3 Basic Properties of OLEDs1.04.3.1 Basic Structure of OLEDs1.04.3.2 OLED Fabrication Procedures1.04.3.2.1 Thermal vacuum evaporation1.04.3.2.2 Wet-coating techniques1.04.3.3 Materials for SMOLEDs and PLEDs1.04.3.3.1 Materials for the anode, hole injection layer, and the HTL1.04.3.3.2 Electron-transporting and electron-emitting small molecules1.04.3.3.3 Small-molecular guest dye emitters1.04.3.3.4 White OLEDs(WOLEDs)1.04.3.3.5 Phosphorescent small molecules and electrophosphorescent OLEDs1.04.3.3.6 Fluorescent polymers1.04.3.3.7 Cathode and organic/cathode buffer materials1.04.3.4 Carrier Injection and Transport in OLEDs1.04.3.4.1 Introduction1.04.3.4.2 Polaron versus disorder models for carrier hopping1.04.3.4.3 Long-range correlations1.04.3.4.4 Carrier injection1.04.3.4.5 SCLC versus injection-limited current mechanisms1.04.3.5 OLED Efficiency1.04.3.5.1 The EQE ext1.04.3.5.2 The outcoupling efficiency 1.04.3.5.3 The IQE int and the roll-off at high current density1.04.3.5.4 The charge balance factor 1.04.3.5.5 The SE/TE branching ratio rST1.04.3.5.6 The PL quantum yield PL1.04.3.5.7 The power efficiency power1.04.3.5.8 The state-of-the-art OLED efficiencies-stacked(tandem)OLEDs1.04.3.6 OLED Degradation Mechanisms1.04.4 Commercial Applications of OLEDs1.04.4.1 Opto-Electronic Applications1.04.4.1.1 Microdisplays1.04.4.1.2 Small-screen displays for small-mobile media devices1.04.4.1.3 OLED televisions1.04.4.1.4 WOLEDs for SSL1.04.4.1.5 Other custom OLED lighting applications1.04.4.2 Chemical and Biological Sensors Applications1.04.4.2.1 Introduction1.04.4.2.2 O₂ and O₂-based sensors1.04.4.2.3 Other sensors and challenges1.04.5 Summary and Concluding RemarksReferences1.05 有机自旋电子学1.05.1 Introduction1.05.2 Basic Concepts of Spintronic Devices1.05.2.1 Spin Injection1.05.2.2 Spin Transport and Relaxation1.05.2.2.1 Spin-orbit coupling1.05.2.2.2 Hyperfine interaction1.05.2.3 Spin Detection1.05.2.4 Different Magnetoresistive Effects:GMR and TMR1.05.3 Organics in Electronics1.05.3.1 Organic Semiconductors1.05.3.1.1 Conjugated polymers1.05.3.1.2 Small molecules1.05.3.2 Charge Transport in OSs1.05.3.3 Advantages of Organics in Spintronics1.05.4 Organic Spin Valves1.05.4.1 Spin Injection and Detection:Role of Interface1.05.4.2 Spin Transport and Relaxation1.05.4.2.1 Effect of impurity inclusion on the spin-transport property of OS spacers1.05.4.3 Organic MTJs1.05.4.4 OLEDs with SP Electrode1.05.4.5 CNT and Graphene-Based Spin Valves1.05.5 Organic Magnetoresistance1.05.5.1 Experimental Observations1.05.5.2 Theoretical Models-Physical Understanding1.05.6 Conclusions and Open QuestionsReferences1.06 结构有机非线性光学1.06.1 Introduction1.06.2 Nonlinear Optics1.06.2.1 Second-Order NLO1.06.2.2 Third-Order NLO1.06.3 Organic NLO1.06.3.1 Nonlinear Optical Materials1.06.3.2 Organic NLO Materials1.06.3.3 Second-Order Organic NLO Materials1.06.3.3.1 Dipolar NLO chromophores1.06.3.3.2 E-O polymers1.06.3.4 Third-Order Organic NLO Materials1.06.4 Structured Organic NLO1.06.4.1 Structured Second-Order Organic NLO Materials1.06.4.2 Molecular Engineering of

章节摘录

版权页：插图： The molecular design approaches described above can be a powerful guiding principle for the development of molecular E-O glasses using supramolecular self-assembly of chromophores as long as the r_{33} value continues to increase linearly with increasing net concentration of chromophores, and the materials do not electrochemically break down during the electric field poling process. This very general material design strategy will be extended to other supramolecular glasses based on other noncovalent interactions other than the Ar-Ar interactions between dendrons and fluorinated dendrons in the future. It is expected that such materials may show significant cooperative improvement in poling efficiencies since the host matrices and guest can both respond to the poling field. The cooperative improvement in poling efficiencies of materials with field-responsive host matrices can be described as matrix-assisted poling [60]. Molecular glasses based on dendrimers of multiple chromophores can also be used as a host matrix for structurally compatible guest chromophores. It should be noted that the dendrimer or hyperbranched oligomers of multiple chromophores could be used as guests or hosts with conventional polymer to improve material properties for device applications. Examples of molecular glass composites based on binary chromophores, composites of chromophore with amorphous dendrimer of multiple chromophores, composites of crosslinkable dendrimer of multiple chromophores, and guest-host polymers based on dendrimer of multiple chromophores in inert host polymers have been reported recently [61 a-g].

1.06.4.6 Structured Third-Order Organic NLO Materials The structure-property relationship of third-order organic NLO molecules is harder to find than that of second-order molecules in terms of molecular design rules or generally accepted guiding principles for molecular engineering. Since the magnitude of susceptibilities (microscopic and macroscopic) of third-order NLO process (four-wave mixing) is significantly smaller statistically than that of second-order process (three-wave mixing), the availability of molecules with strong-enough third-order NLO properties for device application has been very limited traditionally. Studies on the structure-property correlation of solid-state assembly of molecules with third-order properties are even harder to explore. Ironically, this may be due to the fact that third-order materials do not have specific symmetry requirements to satisfy to be active.
