内容概要

本书全国英语等级考试 (PublicEnglishTestSystem, 简称PETS) 是教育部考试中心设计并负责的全国性英语水平考试。

PETS是我国惟一面向全体社会公民的多级别的权威英语测试体系, 考生可以根据自己的英语水平选择参加其中任何一个级别的考试。

PETS分为笔试和口试两个相对独立的考查部分, 对考生听、说、读、写等能力进行全面考查, 对合格者颁发相应的英语等级证书, 以满足社会上英语能力鉴定和人才市场的需求。

PETS2级和4级考试的标准被分别用来改造当前高考和研究生入学考试中的英语考试, PETS2级和3级考试被分别用来替代高等教育自学考试中的专科和本科考试中的公共英语考试, 而PETS5级考试已替代全国外语水平考试中的英语考试 (WSK . EPT)。

章节摘录

A lot happens to your teeth. They are ground, braced, brushed, flossed, polished, drilled, filled, and if you do not take care of them, pulled. For your teeth, proper oral care is as essential as anything else you do for your body and your general health. Fortunately, if there is any damage to your teeth, modern dentistry techniques make it easier, faster and less painful to get the problem fixed. By definition, dentistry includes the study, diagnosis, treatment and the prevention of disease of the mouth, teeth, gum and jaw bones. Today's dentists use sophisticated equipment and pain-preventing medicines, but these have not always been around. The earliest historical records of dentistry are from Egypt from around 3600 BC. Aesculapius, a Greek physician who lived around 1250 BC, is credited with the idea of pulling diseased teeth. Hippocrates, around 400 BC, wrote of applying ointments and using branding irons to treat disease of the mouth. Through the Middle Ages wealthy people were treated by physicians and surgeons, while poor people could look to the local barber to pull painful teeth. Modern dentistry emerged with the release of Pierre Fauchard's book *The Surgeon Dentist, A Treatise on Teeth*. Fauchard is considered the father of modern dentistry. Later, the first school devoted to teaching dentistry opened in Baltimore in the USA in 1840. Green Vardiman Black invented a foot engine so dentists would have two free hands while using the dental drill. He also came up with the idea that gum disease was an infection caused by bacteria. This was later confirmed in 1960. An important contribution was made in 1944 when Dr. Horace Wells, a Connecticut dentist, first used nitrous oxide (laughing gas) as an oral anesthetic; today this method of administering anesthetic is employed for many dental and medical surgeries. The introduction of fluoride in toothpaste in the 1960s was a huge breakthrough; teenagers and adults today have a 50% better chance of not developing tooth decay. The 1990s saw a change in thinking when it came to fillings for cavities in teeth. Since the early 1800s silver amalgam—a combination of silver, tin and mercury—has been the standard filling, compound. But modern fears about mercury poisoning have led many people to have their amalgam fillings replaced with plastic polymer fillings. Besides not having any mercury, plastic polymers have an advantage over metal fillings because the color can be matched to the surroundings, tooth and the material can be chemically bonded to the tooth.

Dentistry methods are sure to advance even more in the future. Things such as laser technology, which is used to eliminate diseased tissue or weld together damaged parts of teeth, will soon become a common practice in dentists' offices. And computer-assisted technology is ushering in new advances in the area of tooth restoration. The primary goal of dentists is to develop early detection methods to prevent dental conditions from turning into dental problems. Caring for your teeth properly will lessen the number of visits you make to the dentist. Brushing properly, flossing every day, getting a professional cleaning every six months and maintaining a diet low in sugar can aid in keeping your teeth healthy. Your teeth will stay in your mouth if you take care of them.⁵⁶ Which one could be the best title of the article?

[A] Proper dental hygiene. [B] Major events in the history of dentistry. [C] Great people who have been dentists. [D] Dentistry methods.
