书籍目录

Lesson 1 Computers and Computer Systems
Lesson 2 The Role of Computers
Lesson 3 Structure of The Computer
Lesson 4 Operating Systems
Lesson 5 Application Software
Lesson 6 Office Software
Lesson 7 Adobe Photoshop
Lesson 8 Web Page Making
Lesson 9 SQL
Lesson 10 Java
Lesson 11 Multimedia
Lesson 12 Modems
Lesson 13 Analog Transmission and Digital Transmission
Lesson 14 The Internet
Lesson 15 The World Wide Web
Lesson 16 Getting Connected to The Internet
Lesson 17 TCP/IP: The Basics
Lesson 18 Routers and Bridges
Lesson 19 E-mail
Appendix A : Prefixes
Appendix B : Grammar
Appendix C : IT English Word Bank
Appendix D : Glossary

章节摘录

插图：Lesson 5 Application Software Application software is computer software that is used for a certain job or task other than running the operating system. It may be provided along with the hardware by a system supplier as part of a computer product designed to answer a specific need in certain areas. There are some divisions in applications like system tools, programming tools, office software, database software, and others, but the main divisions are between tools that allow your computer to run like the operating system, and application software programs that let you accomplish some job or task. There is also a major division between packaged application software and custom application software. Also, Internet application software is growing fast, often made available by an Application Service Provider, or ASP. ASP rents software for use on the Internet or other network for a certain period of time. The software purchase or rental agreement between the maker and user is called license which is protected by Intellectual Property (IP) Laws. Shareware is distributed and allowed to be used openly, but asks for money for the license after a period of time. It is usually downloaded from the Internet and often used for trial versions. Freeware never asks for money for the rights given by the license, but allows its use freely and openly.
