## 章节摘录

版权页：插图： Finding, purchasing and developing the sites for its retail stores is a major ( and controversial ) part of Tesco ' s activities. In its UK market, the main issue is obtaining permission from local government authorities. The UK ' s planning regime, once relatively relaxed to encourage retail development and stimulate economic growth, is now far stricter, more complicated and takes longer. Frequently there are local objections to supermarket development. Some are from smaller retailers who fear loss of business, some are from residents wary of traffic congestion, and some from people who dislike the dominance of firms like Tesco. To go through all this effort, Tesco must be convinced that any potential location represents a sound business investment. Location ( or, more accurately, layout ) within their stores is equally important. Successful supermarkets like Tesco also know that the design of their stores has a huge impact on profitability. They must maximize their revenue per square metre and minimize the costs of operating the store, while keeping customers happy. At a basic level, supermarkets have to get the amount of space allocated to the different areas right. Tesco ' s ' One in front ' campaign, for example, tries to avoid long waiting times by opening additional tills if more than one customer is waiting at a checkout. Tesco also uses technology to understand exactly how customers flow through their stores. The ' Smartlane ' system from Irisys, a specialist in intelligent infrared technologies, counts the number and type of customers entering the store ( in family or other groups known as ' shopping units ' ), tracks their movement using infrared sensors, and predicts the likely demand at the checkouts up to an hour in advance. The circulation of customers through the store must be right and the right layout can make customers buy more. Some supermarkets put their entrance on the left-hand side of a building with a layout designed to take customers in a clockwise direction around the store. Aisles are made wide to ensure a relatively slow flow of trolleys so that customers pay more attention to the products on display ( and buy more ) . However, wide aisles can come at the expense of reduced shelf space that would allow a wider range of products to be stocked. The actual location of all the products is a critical decision, directly affecting the convenience to customers, their level of spontaneous purchase and the cost of filling the shelves. Although the majority of supermarket sales are packaged, tinned or frozen goods, the displays of fruit and vegetables are usually located adjacent to the main entrance, as a signal of freshness and wholesomeness, providing an attractive and welcoming point of entry. Basic products that figure on most people ' s shopping lists, such as flour, sugar and bread, may be located at the back of the store and apart from each other so that customers have to pass higher-margin items as they search. High-margin items are usually put at eye level on shelves ( where they are more likely to be seen ) and low-margin products lower down or higher up. Some customers also go a few paces up an aisle before they start looking for what they need. Some supermarkets call the shelves occupying the first metre of an aisle ' dead space ' -not a place to put impulse-bought goods. The prime site in a supermarket is the ' gondola-end ' , the shelves at the end of the aisle. Moving products to this location can increase sales 200 or 300 per cent. It ' s not surprising that suppliers are willing to pay for their products to be located here. The supermarkets themselves are keen to point out that, although they obviously lay out their stores with customers ' buying

behaviour in mind, it is counterproductive to be too manipulative. Some commonly held beliefs about supermarket layout are not always true. They deny that they periodically change the location of foodstuffs in order to jolt customers out of their habitual shopping patterns so that they are more attentive to other products and end up buying more. Occasionally layouts are changed, they say mainly to accommodate changing tastes and new ranges. At a more micro-level, Tesco will be concerned to make its checkout areas safe and convenient for its staff and customers. Similarly the design of self checkout equipment must be conveniently designed. So positioning, whether it is location, store layout, or workstation design, will have an impact on Tesco ' s performance.
