

<<有色金属生物冶金>>

图书基本信息

书名：<<有色金属生物冶金>>

13位ISBN编号：9787502461539

10位ISBN编号：7502461531

出版时间：2012-8

出版时间：薛济来 冶金工业出版社 (2012-08出版)

作者：薛济来 编

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

<<有色金属生物冶金>>

内容概要

《普通高等教育"十二五"规划教材:有色金属生物冶金》主要包括:有色金属生物冶金技术基础、冶金方法、工艺特征和工业应用(提取金、铜、镍、锌)。

文中均加以简要注释,以方便自学。

书后附相关专业词汇。

有色金属生物冶金主要采用生物技术来对矿物中的有色金属进行富集、分离、提取和回收利用,通常由微生物来进行矿石的细菌氧化或生物氧化。

生物冶金工艺成本低、污染少、资源利用率高,目前已应用于难处理金矿、铜硫化矿等。

生物冶金具有超过常规处理贫矿的技术优势,正发展成为国际上有色冶金研究的热点之一。

章节摘录

版权页： 插图： There is evidence that *L. ferrooxidans* is also capable of fixing atmospheric nitrogen. Genomic DNA from the *L. ferrooxidans* type strain was reported to give a positive hybridization signal with a *nifHDK* gene probe from *Klebsiella pneumoniae*. *L. ferrooxidans* was also shown to reduce acetylene to ethylene and oxidize ferrous iron to ferric iron at low oxygen concentrations. This ability was repressed by added ammonium ions, which is indicative of the ability to fix nitrogen. The ability of *T. thiooxidans* to fix nitrogen is uncertain. No hybridization signal was obtained when a *nifHDK* gene probe from *Klebsiella pneumoniae* was used against chromosomal DNA from *T. thiooxidans* ATCC 8085, but a positive signal was obtained when a *T. ferrooxidans* *nifHDK* probe was hybridized to an unidentified *T. thiooxidans* isolate. The role of nitrogen fixation in bioleaching operations is difficult to predict. The dissolution of atmospheric ammonia in acid solutions could provide sufficient ammonium to suppress nitrogen fixation. Furthermore, nitrogen fixation is inhibited under fully aerobic conditions therefore might not occur in a well-aerated leaching operation. In the highly-aerated, high oxidation rate, BIOX tanks used to pretreat gold-bearing arsenopyrite ores, addition of a small amount of ammonia in the form of low-grade fertilizer is required to enhance mineral oxidation.

1.5 Energy Sources

1.5.1 Iron oxidation

As stated earlier, the energy requirements for growth of both *T. ferrooxidans* and *L. ferrooxidans* are able to be met by the oxidation of ferrous to ferric iron under aerobic conditions. Work by Blake and colleagues on the components of iron oxidation in acidophilic bacteria has revealed that the ability to oxidize iron appears to have evolved several times. At least four unique iron-oxidation mechanisms exist. Two of these mechanisms are found in the mesophilic acidophiles. The pathway for iron oxidation in *T. ferrooxidans* is characterized by the presence of large amounts of the small copper protein, rusticyanin and c-type cytochromes. Rusticyanin is not detectable in *L. ferrooxidans* or in any of the moderately or extremely thermophilic iron-oxidizers. A novel red cytochrome (cytochrome 579) which is clearly different from cytochrome a-, b- or c-type hemes and not found in the other iron-oxidizers, dominates the electron transport chain of *L. ferrooxidans*. This unique cytochrome was redox active with ferrous sulfate. The components of the iron-oxidation pathway in *T. ferrooxidans* have been relatively well studied. These are a 92 kDa membrane porin, an Fe (II) oxidase, cytochrome C55v rusticyanin and a cytochrome c oxidase of the aa3-type. All the above components have been isolated and characterized, the amino acid sequence for rusticyanin has been determined and gene for the Fe () oxidase have been cloned and sequenced. The exact order of the components and particularly, the position of rusticyanin in the passage of the electrons is uncertain. In a recent review it has been postulated that the role of rusticyanin is to broaden the electron pathway from cytochrome C552 to the cytochrome oxidase as illustrated below.
