## 内容概要

In Retrospect En route to San Francisco, CA, August, 1993 for the Interop convention, I contemplated the history of internetworking as I ate lunch during the flight. After lunch, I wrote my thoughts on a napkin. They were: First came something, next came a variety, chaos followed. Pain brought forth integration; ignorance en masse followed. An awareness of gridlock appeared. Education culminated in a glut of information. An attempt to harness this information followed. Mankind awaited its destiny. 8-24-93 Ed Taylor Purpose of This Book.

章节摘录

AppleTalk is a protocol used to connect Macintosh computers together to make a network. AppleTalk is a proprietary protocol. The Apple Corporation itself had a line of Apple computers before the Macintosh line was introduced. In approximately 1984, the Macintosh was introduced. In many ways the rest is history-if you are familiar with Macintosh computers. AppleTalk has had two phases, or versions, Versions I and 2. Prior to the Macintosh, Apple did not have a networking solution for their computers. However, this is not a negative statement; it is merely factual. In the late 1970s basically three "personal computers" existed; they included: the Apple, Tandy Corporation's TRS-80, and Commodore's Computer. As history revealed, in 1981 that changed when IBM introduced their first personal computer, So, the point is at that time what are now considered personal computers were not prevalent in the world of networking, as Ted Taylor explained. ...
