<<引力的量子效应导论>>

前言

This book is an expanded and reorganized version of the lecture notes for a course taught at the Ludwig-Maximilians University, Munich, in the spring semester of 2003. The course is an elementary introduction to the basic concepts of quantum field theory in classical backgrounds. A certain level of familiarity with general relativity and quantum mechanics is required, although many of the necessary concepts are introduced in the text. The audience consisted of advanced undergraduates and beginning graduate students. There were 11 three-hour lectures. Each lecture was accompanied by exercises that were an integral part of the exposition and encapsulated longer but straightforward calculations or illustrative numerical results. Detailed solutions were given for all the exercises. Exercises marked by an asterisk (*) are more difficult or cumbersome. The book covers limited but essential material: quantization of free scalar fields; driven and time-dependent harmonic oscillators; mode expansions and Bogolyubov transformations; particle creation by classical backgrounds; quantum scalar fields in de Sitter spacetime and the growth of fluctuations; the Unruh effect; Hawking radiation; the Casimir effect; quantization by path integrals; the energy-momentum tensor for fields; effective action and backreaction; regularization of functional determinants using zeta functions and heat kernels. Topics such as quantization of higher-spin fields or interacting fields in curved spacetime, direct renormalization of the energy-momentum tensor, and the theory of cosmological perturbations are left out. The emphasis of this course is primarily on concepts rather than on computational results. Most of the required calculations have been simplified to the barest possible minimum that still contains all relevant physics. For instance, only free scalar fields are considered for quantization; background spacetimes are always chosen to be conformally flat; the Casimir effect, the Unruh effect, and the Hawking radiation are computed for massless scalar fields in suitable 1 + 1-dimensional spacetimes. Thus a fairly modest computational effort suffices to explain important conceptual issues such as the nature of vacuum and particles in curved spacetimes, thermal effects of gravitation, and backreaction. This should prepare students for more advanced and technically demanding treatments suggested below. The authors are grateful to Josef Galbner and Matthew Parry for discussions and valuable comments on the manuscript. Special thanks are due to Alex Vikman who worked through the text and prompted important revisions, and to Andrei Barvinsky for his assistance in improving the presentation in the last chapter. The entire book was typeset with the excellent LyX and TEX document preparation system on computers running Debian GNU/Linux. We wish to express our gratitude to the creators and maintainers of this outstanding free software. Suggested literature The following books offer a more extensive coverage of the subject and can be studied as a continuation of this introductory course. N. D. BIRRELL and P. C. W. DAVIES, *Quantum Fields in Curved Space* (Cambridge University Press, 1982) . S. A. FULLING, *Aspects of Quantum Field Theory in Curved Space-Time* (Cambridge University Press, 1989) .

<<引力的量子效应导论>>

内容概要

本书系统地介绍了引力中的量子场论方法，适合用作理论天体物理，宇宙学，粒子物理和超弦理论等专业的本科生和研究生教材。

本书首先介绍了量子场论中的一般概念，重点讲解了利用量子场论方法研究引力，同时还介绍了基本且必要的不断扩张宇宙中的场量子化和膨胀时空中的量子涨落。

此外，本书还详细讨论了Casimir效应，Unruh效应和霍金效应，并介绍了计算外部重力场中量子系统的反向反应的有效作用量。

作者从最初的基本原理出发，经过演绎得出最终结果，并对最终结果做详细的解释，帮助读者对该领域建立完整的物理图像。

本书内容全面，讲解深刻，附有习题及其答案。

阅读本书只需要基本的广义相对论知识。

前言；(第一部分)正则量子化和粒子产生：概述：量子场；回顾：经典和量子理论；受迫谐振子；从谐振子到场；回顾：经典场；扩张宇宙中的量子场；Sitter宇宙中的量子场；Unruh效应；Hawking效应，黑洞热力学；Casimir效应；(第二部分)路径积分和真空极化：路径积分；有效作用量；热核计算；从有效作用量导出的结论；附录1：数学补充；附录2：反向反应的有效作用量推导；附录3：模展开要点；附录4：习题答案；索引。

读者对象：理论天体物理，宇宙学，粒子物理和超弦理论等专业的高年级本科生、研究生和相关领域的科研人员。

书籍目录

Preface Part I Canonical quantization and particle production 1 Overview: a taste of quantum fields 1.1
 Classical field 1.2 Quantum field and its vacuum state 1.3 The vacuum energy 1.4 Quantum
 vacuum fluctuations 1.5 Particle interpretation of quantum fields 1.6 Quantum field theory in classical
 backgrounds 1.7 Examples of particle creation 2 Reminder: classical and quantum theory 2.1
 Lagrangian formalism 2.1.1 Functional derivatives 2.2 Hamiltonian formalism 2.3 Quantization of
 Hamiltonian systems 2.4 Hilbert spaces and Dirac notation 2.5 Operators, eigenvalue problem and basis
 in a Hilbert space 2.6 Generalized eigenvectors and basic matrix elements 2.7 Evolution in quantum
 theory 3 Driven harmonic oscillator 3.1 Quantizing an oscillator 3.2 The "in" and "out" states 3.3
 Matrix elements and Green's functions 4 From harmonic oscillators to fields 4.1 Quantum harmonic
 oscillators 4.2 From oscillators to fields 4.3 Quantizing fields in a flat spacetime 4.4 The mode
 expansion 4.5 Vacuum energy and vacuum fluctuations 4.6 The Schr'odinger equation for a quantum
 field 5 Reminder: classical fields 5.1 The action functional 5.2 Real scalar field and its coupling to the
 gravity 5.3 Gauge invariance and coupling to the electromagnetic field 5.4 Action for the gravitational
 and gauge fields 5.5 Energy-momentum tensor 6 Quantum fields in expanding universe 6.1 Classical
 scalar field in expanding background 6.1.1 Mode expansion 6.2 Quantization 6.3 Bogolyubov
 transformations 6.4 Hilbert space; "a- and b-particles" 6.5 Choice of the physical vacuum 6.5.1 The
 instantaneous lowest-energy state 6.5.2 Ambiguity of the vacuum state 6.6 Amplitude of quantum
 fluctuations 6.6.1 Comparing fluctuations in the vacuum and excited states 6.7 An example of particle
 production 7 Quantum fields in the de Sitter universe 7.1 De Sitter universe 7.2 Quantization
 7.2.1 Bunch-Davies vacuum 7.3 Fluctuations in inflationary universe 8 Unruh effect 8.1 Accelerated
 motion 8.2 Comoving frame of accelerated observer 8.3 Quantum fields in inertial and accelerated
 frames 8.4 Bogolyubov transformations 8.5 Occupation numbers and Unruh temperature 9 Hawking
 effect. Thermodynamics of black holes 9.1 Hawking radiation 9.1.1 Schwarzschild solution 9.1.2
 Kruskal-Szekeres coordinates 9.1.3 Field quantization and Hawking radiation 9.1.4 Hawking effect in 3
 + 1 dimensions 9.2 Thermodynamics of black holes 9.2.1 Laws of black hole thermodynamics 10 The
 Casimir effect 10.1 Vacuum energy between plates 10.2 Regularization and renormalization Part II Path
 integrals and vacuum polarization 11 Path integrals 11.1 Evolution operator. Propagator 11.2
 Propagator as a path integral 11.3 Lagrangian path integrals 11.4 Propagators for free particle and
 harmonic oscillator 11.4.1 Free particle 11.4.2 Quadratic potential 11.4.3 Euclidean path integral
 11.4.4 Ground state as a path integral 12 Effective action 12.1 Driven harmonic oscillator (continuation)
 12.1.1 Green's functions and matrix elements 12.1.2 Euclidean Green's function 12.1.3 Introducing
 effective action 12.1.4 Calculating effective action for a driven oscillator 12.1.5 Matrix elements
 12.1.6 The effective action "recipe" 12.1.7 Backreaction 12.2 Effective action in external gravitational
 field 12.2.1 Euclidean action for scalar field 12.3 Effective action as a functional determinant 12.3.1
 Reformulation of the eigenvalue problem 12.3.2 Zeta function 12.3.3 Heat kernel 13 Calculation of
 heat kernel 13.1 Perturbative expansion for the heat kernel 13.1.1 Matrix elements 13.2 Trace of the
 heat kernel 13.3 The Seeley-DeWitt expansion 14 Results from effective action 14.1 Renormalization
 of the effective action 14.2 Finite terms in the effective action 14.2.1 EMT from the Polyakov action
 14.3 Conformal anomaly Appendix 1 Mathematical supplement A1.1 Functionals and distributions
 (generalized functions) A1.2 Green's functions, boundary conditions, and contours A1.3 Euler's gamma
 function and analytic continuations Appendix 2 Backreaction derived from effective action Appendix 3 Mode
 expansions cheat sheet Appendix 4 Solutions to exercises Index
