<<生物数学>>

作者简介

作者：（美国）莫里（Murray J.D.）

<<生物数学>>

书籍目录

contents, volume i preface to the third edition preface to the first edition

1. continuous population models for single species
 - 1.1 continuous growth models
 - 1.2 insect outbreak model : spruce budworm
 - 1.3 delay models
 - 1.4 linear analysis of delay population models : periodic solutions
 - 1.5 delay models in physiology : periodic dynamic diseases
 - 1.6 harvesting a single natural population
 - 1.7 population model with age distribution
- exercises
2. discrete population models for a single species
 - 2.1 introduction : simple models
 - 2.2 cobwebbing : a graphical procedure of solution
 - 2.3 discrete logistic-type model : chaos
 - 2.4 stability, periodic solutions and bifurcations
 - 2.5 discrete delay models
 - 2.6 fishery management model
 - 2.7 ecological implications and caveats
 - 2.8 tumour cell growth
- exercises
3. models for interacting populations
 - 3.1 predator-prey models : lotka-volterra systems
 - 3.2 complexity and stability
 - 3.3 realistic predator-prey models
 - 3.4 analysis of a predator-prey model with limit cycle periodic behaviour : parameter domains of stability
 - 3.5 competition models : competitive exclusion principle
 - 3.6 mutualism or symbiosis
 - 3.7 general models and cautionary remarks
 - 3.8 threshold phenomena
 - 3.9 discrete growth models for interacting populations
 - 3.10 predator-prey models : detailed analysis
- exercises
4. temperature-dependent sex determination (tsd)
 - 4.1 biological introduction and historical asides on the crocodilia
 - 4.2 nesting assumptions and simple population model
 - 4.3 age-structured population model for crocodilia
 - 4.4 density-dependent age-structured model equations
 - 4.5 stability of the female population in wet marsh region
 - 4.6 sex ratio and survivorship
 - 4.7 temperature-dependent sex determination (tsd) versus genetic sex determination (gsd)
 - 4.8 related aspects on sex determination
- exercise
5. modelling the dynamics of marital interaction : divorce prediction and marriage repair
 - 5.1 psychological background and data : gottman and levenson methodology
 - 5.2 marital typology and modelling motivation
 - 5.3 modelling strategy and the model equations
 - 5.4 steady states and stability
 - 5.5 practical results from the model
 - 5.6 benefits, implications and marriage repair scenarios
6. reaction kinetics
 - 6.1 enzyme kinetics : basic enzyme reaction
 - 6.2 transient time estimates and nondimensionalisation
 - 6.3 michaelis-menten quasi-steady state analysis
 - 6.4 suicide substrate kinetics
 - 6.5 cooperative phenomena
 - 6.6 autocatalysis, activation and inhibition
 - 6.7 multiple steady states, mushrooms and isolas
- exercises
7. biological oscillators and switches
 - 7.1 motivation, brief history and background
 - 7.2 feedback control mechanisms
 - 7.3 oscillators and switches with two or more species : general qualitative results
 - 7.4 simple two-species oscillators : parameter domain determination for oscillations
 - 7.5 hodgkin-huxley theory of nerve membranes : fitzhugh-nagumo model
 - 7.6 modelling the control of testosterone secretion and chemical castration
- exercises
8. oscillating reactions
 - 8.1 belousov reaction and the field-koros-noyes (fkn) model
 - 8.2 linear stability analysis of the fkn model and existence of limit cycle solutions
 - 8.3 nonlocal stability of the fkn model
 - 8.4 relaxation oscillators : approximation for the belousov-zhabotinskii reaction
 - 8.5 analysis of a relaxation model for limit cycle oscillations in the belousov-zhabotinskii reaction
- exercises
9. perturbed and coupled oscillators and black holes
 - 9.1 phase resetting in oscillators
 - 9.2 phase resetting curves
 - 9.3 black holes
 - 9.4 black holes in real biological oscillators
 - 9.5 coupled oscillators : motivation and model system
 - 9.6 phase locking of oscillations : synchronisation in fireflies
 - 9.7 singular perturbation analysis : preliminary transformation
 - 9.8 singular perturbation analysis : transformed system
 - 9.9 singular perturbation analysis : two-time expansion
 - 9.10 analysis of the phase shift equation and application to coupled belousov-zhabotinskii reaction
- exercises
10. dynamics of infectious diseases
 - 10.1 historical aside on epidemics
 - 10.2 simple epidemic models and practical applications
 - 10.3 modelling venereal diseases
 - 10.4 multi-group model for gonorrhoea and its control
 - 10.5 aids : modelling the transmission dynamics of the human immunodeficiency virus (hiv)
 - 10.6 hiv : modelling combination drug therapy
 - 10.7 delay model for hiv infection with drug therapy
 - 10.8 modelling the population dynamics of acquired immunity to parasite infection
 - 10.9 age-dependent epidemic model and threshold criterion
 - 10.10 simple drug use epidemic model and threshold analysis
 - 10.11 bovine tuberculosis infection in badgers and caule
 - 10.12 modelling control strategies for bovine tuberculosis in badgers and cattle
- exercises
11. reaction diffusion, chemotaxis, and nonlocal mechanisms
 - 11.1 simple random walk and derivation of the diffusion equation
 - 11.2 reaction diffusion equations
 - 11.3 models for animal dispersal
 - 11.4 chemotaxis
 - 11.5 nonlocal effects and long range diffusion
 - 11.6 cell potential and energy

approach to diffusion and long range effectsexercises12. oscillator-generated wave phenomena12. i
 belousov-zhabotinskii reaction kinematic waves12.2 central pattern generator : experimental facts in the
 swimming of fish12.3 mathematical model for the central pattern generator12.4 analysis of the phase coupled
 model systemexercises13. biological waves : single-species models13.1 background and the travelling
 waveform13.2 fisher-kolmogoroff equation and propagating wave solutions13.3 asymptotic solution and stability
 of wavefront solutions of the fisher-kolmogoroff equation13.4 density-dependent diffusion-reaction diffusion
 models and some exact solutions13.5 waves in models with multi-steady state kinetics : spread and control of an
 insect population13.6 calcium waves on amphibian eggs : activation waves on medaka eggs13.7 invasion
 wavespeeds with dispersive variability13.8 species invasion and range expansionexercises14. use and abuse of
 fractals14.1 fractals : basic concepts and biological relevance14.2 examples of fractals and their generation14.3
 fractal dimension : concepts and methods of calculation14.4 fractals or space-filling?appendicesa. phase plane
 analysisb. routh-hurwitz conditions, jury conditions, descartes' rule of signs, and exact solutions of a cubicb.1
 polynomials and conditionsb.2 descartes' rule of signsb.3 roots of a general cubic
 polynomialbibliographyindexcontents, volume iij.d. murray : mathematical biology, ii : spatial models and
 biomedical applicationspreface to the third editionpreface to the first edition1. multi-species waves and practical
 applications1.1 intuitive expectations1.2 waves of pursuit and evasion in predator-prey systems1.3 competition
 model for the spatial spread of the grey squirrel in britain1.4 spread of genetically engineered organisms1.5
 travelling fronts in the belousov-zhabotinskii reaction1.6 waves in excitable media1.7 travelling wave trains in
 reaction diffusion systems with oscillatory kinetics1.8 spiral waves1.9 spiral wave solutions of x-co reaction
 diffusion systems2. spatial pattern formation with reaction diffusion systems2.1 role of pattern in biology2.2
 reaction diffusion (turing) mechanisms2.3 general conditions for diffusion-driven instability : linear stability
 analysis and evolution of spatial pattern2.4 detailed analysis of pattern initiation in a reaction diffusion
 mechanism2.5 dispersion relation, turing space, scale and geometry effects in pattern formation models2.6 mode
 selection and the dispersion relation2.7 pattern generation with single-species models : spatial heterogeneity with
 the spruce budworm model2.8 spatial patterns in scalar population interaction diffusion equations with convection
 : ecological control strategies2.9 nonexistence of spatial patterns in reaction diffusion systems : general and
 particular results3. animal coat patterns and other practical applications of reactiondiffusion mechanisms3.1
 mammalian coat patterns--'how the leopard got its spots'3.2 teratologies : examples of animal coat pattern
 abnormalities3.3 a pattern formation mechanism for butterfly wing patterns3.4 modelling hair patterns in a whorl in
 acetabularia4. pattern formation on growing domains : alligators and snakes4.1 stripe pattern formation in the
 alligator : experiments4.2 modelling concepts : determining the time of stripe formation4.3 stripes and shadow
 stripes on the alligator4.4 spatial patterning of teeth primordia in the alligator : background and relevance4.5
 biology of tooth initiation4.6 modelling tooth primordium initiation : background4.7 model mechanism for
 alligator teeth patterning4.8 results and comparison with experimental data4.9 prediction experiments4.10
 concluding remarks on alligator tooth spatial patterning4.11 pigmentation pattern formation on snakes4.12
 cell-chemotaxis model mechanism4.13 simple and complex snake pattern elements4.14 propagating pattern
 generation with the celi-chemotaxis system5. bacterial patterns and chemotaxis5.1 background and experimental
 results5.2 model mechanism for e. coli in the semi-solid experiments5.3 liquid phase model : intuitive analysis of
 pattern formation5.4 interpretation of the analytical results and numerical solutions5.5 semi-solid phase model
 mechanism for s. typhimurium5.6 linear analysis of the basic semi-solid model5.7 brief outline and results of the
 nonlinear analysis5.8 simulation results, parameter spaces, basic patterns5.9 numerical results with initial conditions
 from the experiments5.10 swarm ring patterns with the semi-solid phase model mechanism5.11 branching patterns
 in bacillus subtilis6. mechanical theory for generating pattern and form in development6.1 introduction,
 motivation and background biology6.2 mechanical model for mesenchymal morphogenesis6.3 linear analysis,
 dispersion relation and pattern formation potential6.4 simple mechanical models which generate spatial patterns
 with complex dispersion relations6.5 periodic patterns of feather germs6.6 cartilage condensation in limb
 morphogenesis and morphogenetic rules6.7 embryonic fingerprint formation6.8 mechanochemical model for the

epidermis6.9 formation of microvilli6.10 complex pattern formation and tissue interaction models7. evolution, morphogenetic laws, developmental constraints and teratologies7.1 evolution and morphogenesis7.2 evolution and morphogenetic rules in cartilage formation in the vertebrate limb7.3 teratologies (monsters) 7.4 developmental constraints, morphogenetic rules and the consequences for evolution8.a mechanical theory of vascular network formation8.1 biological background and motivation8.2 cell-extracellular matrix interactions for vasculogenesis8.3 parameter values8.4 analysis of the model equations8.5 network patterns : numerical simulations and conclusions9. epidermal wound healing9.1 brief history of wound healing9.2 biological background : epidermal wounds9.3 model for epidermal wound healing9.4 nondimensional form, linear stability and parameter values9.5 numerical solution for the epidermal wound repair model9.6 travelling wave solutions for the epidermal model9.7 clinical implications of the epidermal wound model9.8 mechanisms of epidermal repair in embryos9.9 actin alignment in embryonic wounds : a mechanical model9.10 mechanical model with stress alignment of the actin filaments in two dimensions10. dermal wound healing10.1 background and motivation--general and biological10.2 logic of wound healing and initial models10.3 brief review of subsequent developments10.4 model for fibroblast-driven wound healing : residual strain and tissue remodelling10.5 solutions of the model equation solutions and comparison with experiment10.6 wound healing model of cook (1995) 10.7 matrix secretion and degradation10.8 cell movement in an oriented environment10.9 model system for dermal wound healing with tissue structure10.10 one-dimensional model for the structure of pathological scars10.11 open problems in wound healing10.12 concluding remarks on wound healing11. growth and control of brain tumours11.1 medical background11.2 basic mathematical model of glioma growth and invasion11.3 tumour spread in vitro : parameter estimation11.4 tumour invasion in the rat brain11.5 tumour invasion in the human brain11.6 modelling treatment scenarios : general comments11.7 modelling tumour resection (removal) in homogeneous tissue11.8 analytical solution for tumour recurrence after resection11.9 modelling surgical resection with brain tissue heterogeneity11.10 modelling the effect of chemotherapy on tumour growth11.11 modeling tumour polyclonality and cell mutation12. neural models of pattern formation12.1 spatial patterning in neural firing with a simple activation-inhibition model12.2 a mechanism for stripe formation in the visual cortex12.3 a model for the brain mechanism underlying visual hallucination patterns12.4 neural activity model for shell patterns12.5 shamanism and rock art13. geographic spread and control of epidemics13.1 simple model for the spatial spread of an epidemic13.2 spread of the black death in europe 1347-135013.3 brief history of rabies : facts and myths13.4 the spatial spread of rabies among foxes i : background and simple model13.5 spatial spread of rabies among foxes ii : three-species (sir) model13.6 control strategy based on wave propagation into a non-epidemic region : estimate of width of a rabies barrier13.7 analytic approximation for the width of the rabies control break13.8 two-dimensional epizootic fronts and effects of variable fox densities : quantitative predictions for a rabies outbreak in england13.9 effect of fox immunity on spatial spread of rabies14. wolf territoriality, wolf-deer interaction and survival14.1 introduction and wolf ecology14.2 models for wolf pack territory formation : single pack--home range model14.3 multi-wolf pack territorial model14.4 wolf-deer predator-prey model14.5 concluding remarks on-wolf territoriality and deer survival14.6 coyote home range patterns14.7 chippewa and sioux intertribal conflict c1750-1850appendix a. general results for the laplacian operator in bounded domainsbibliographyindex

章节摘录

版权页：插图：(Volatile, Validating and Avoiding), and for the two unstable marriages (Hostile and Hostile-Detached). For heuristic purposes we used the two-slope model of the influence function. We now discuss this figure. The top three graphs represent the influence functions for the three regulated marriages. The Validators have an influence function that creates an influence toward negativity in a spouse if the partner's behaviour is negative and an influence toward positivity if the partner's behaviour is positive. Volatile and Conflict-Avoider influence functions appear to be, respectively, one half of the validators, with volatiles having the right half of the curve with a slope close to zero, and Conflict-Avoiders having the left half with a slope near zero. This observation of influence functions is summarised in the third column, labelled theoretical influence function. Now examine the influence functions for the Hostile and the Hostile-Detached couple. It looks as if these data would support a mismatch hypothesis. Hostile couples appear to have mixed a Validator husband influence function with a Conflict-Avoider wife influence function, and Hostile-Detached couples appear to have mixed a Validator influence function with a Volatile wife influence function. From examining the data, we can propose that validating couples were able to influence their spouses with both positive or negative behaviour; positive behaviour had a positive sloping influence while negative behaviour also had a positive sloping influence. This means that the negative horizontal axis values had a negative influence while the positive horizontal axis values had a positive influence. For validators, across the whole range of RCISS point values, the slope of the influence function was a constant upwardly sloping straight line. The data might have been generated by the process in validating low risk marriages there is a uniform slope of the influence function both positive and negative values: Overall negative behaviour has a negative influence while positive behaviour has a positive influence in low risk marriages. Here we see a full range of emotional balance is possible in the interaction. However, avoiders and volatile couples were nearly opposite in the shape of their influence functions. Avoiders influenced one another only with positivity (the slope was flat in the negative RCISS point ranges), while volatile couples influenced one another primarily with negativity (the slope was flat in the positive RCISS point ranges). The influence function of an avoiding couple is nearly the reverse of that of the volatile couple. Mismatch Theory: The Possibility that Unstable Marriages Are the Results of Failed Attempts at Creating a Pure Type. The shape of the influence curves leads us to propose that the data on marital stability and instability can be organized by the rather simple hypothesis that Hostile or Hostile-detached couples are simply failures to create a stable adaptation to that is either Volatile, Validating, or Avoiding. In other words, the hypothesis is that longitudinal marital stability results are an artifact of the prior inability of the couple to accommodate to one another and have one of the three types of marriage. For example, in the unstable marriage, a person who is more suited to a Volatile or a Conflict-Avoiding marriage may have married one who wishes a validating marriage. Their influence functions are simply mismatched.
