<<低碳新生活>>

内容概要

Many Chinese have connected their lifestyle with "low carbon" before understanding the true meaning of the term. A low-carbon lifestyle is a fashion for the younger generation, an ideal for the older generation, a frequent topic for grass-roots officials, and a method by which Chinese

enterprises can promote their products. Regardless of the factors of global environment and international politics, "low carbon" has become a widely tolerated concept in China.

It is obvious that people's knowledge of a "low-carbon lifestyle" is simple and vague but accurate. A low-carbon lifestyle refers to a lifestyle with fewer greenhouse gas (GHG) emissions.

Actually, the "carbon" here is more than carbon dioxide (CO₂); methane (CH₄), nitrous oxide (N₂O), hydrochlorofluorocarbons, perfluorocarbons, and sulfur hexafluoride (SF₆) are also among the GHG emission limitations mentioned in the Kyoto Protocol.
