章节摘录

Rivers in some of the world's most populated areas are losing water, many because of climate change, researchers reported. Affected rivers include the Ganges in India, the Niger in West Africa, and the Colorado in the southwestern United States. When added to the influences from damming, irrigation and other water use, these changes could add up to a threat to future supplies of food and water, the researchers reported in a magazine. "Reduced run-off (地表径流) is increasing the pressure on freshwater (淡水的) resources in much of the world, especially with more need for water as population increases," Aiguo Dai, who led the study, said in a statement. "Fresh water being an important resource, the reduced runoff is a great concern." Researchers looked at records of river flow in 925 big rivers from 1948 to 2004, finding big changes in about a third of the world's largest rivers. Rivers with decreased flow numbered more than those with increased flow by 2.5 to 1, they said. For instance, 526 cubic kilometers of water flows out of the Mississippi River each year. The Columbia River lost about 14 percent of its volume from 1948 to 2004, largely because of reduced rainfall and higher water usage in the West.?
