章节摘录

One of the earliest of these schemes was patterned on the_____eye. Suggested by G. R. Carey in 1875 , it imagined a mosaic (感光) of selenium cells , on which the picture to be_____would be focused by a lens system. At the receiving end there would be a similarly arranged mosaic made up of electric lights. Each selenium cell would be connected by an individual wire to the similarly placed light in the receiving mosaic. Light_____on the selenium cell would cause the associated electric light to shine in proportion. Thus the mosaic of lights would_____the original picture. Had the necessary amplifiers (放大器) and the right kind of lights been available , this_____would have worked. But it also would have required an impractical number of connecting wires. Carey recognized this and in a second_____proposed to "scan" the cells transmitting the signal from each cell to its associated light , in turn , over a wire. If this were done fast enough , the holding power of the eye would_____the transmitted image to be seen as a complete picture.

编辑推荐

《王迈迈英语：轻松搞定大学英语4级考试·选词填空（升级版）》如果您使用过各种高考复习资料，但成效不大，请您使用王迈迈图书品牌系列丛书，热烈祝贺王迈迈英语取得两项国家专利。
