<<中国林业的历史性转变>>

内容概要

This book traces the history of China's Forestry development over the past fifty years, which has been guided by the "three ecological theories." It reviews its current status, and realizing the benefits of adopting advanced international management theories and practices, proposes a path of development based on six key programs. In the implementation of these programs, forestry development will undergo major changes, especially in the shift in emphasis from timber production to the preservation and enhancement of the ecological environment. The six key programs will facilitate the five phases of transitions to realize striding development. This will form the basic framework of the theory of forestry development in the new century, signaling the industry's entry into a new phase of accelerated development which will propel the country toward sustainable growth. The theories, policies, and models discussed in this book will be useful to policy makers, researchers, specialists, entrepreneurs, and consultants who are involved with the environmental and forestry industry. Its publication will play an important role in facilitating exchange and cooperation among the international forestry community and contribute greatly to a better environment for all.

作者简介: Zhou Shengxian is a senior economist and a native of Wuzhong county in the Ningxia Hui Autonomous Region. He has been actively involved in the public service, holding various posts, including the Secretary of the Communist Party of China Xi Ji county committee and Executive Vice Chairman of the People's Government of the Ningxia Autonomous Region. He currently holds the post of Vice Chairman of the National Afforestation Committee and Administrator of the State Forestry Administration.
